a comprehensive review of dryland climates and their relationship to the physical environment hydrology and inhabitants chapters are divided into five major sections on background meteorology and climatology the nature of dryland climates in relation to precipitation and hydrology the climatology and climate dynamics of the major dryland regions on each continent and life and change in the world s drylands it includes key topics such as vegetation geomorphology desertification micro habitats and adaptation to dryland environments this interdisciplinary volume provides an extensive review of the primary literature covering nearly 2000 references and the conventional and satellite datasets that form key research tools for dryland climatology illustrated with over 300 author photographs it presents a unique view of dryland climates for a broad spectrum of researchers environmental professionals and advanced students in climatology meteorology geography environment science earth system science ecology hydrology and geomorphology

taking a global perspective this book provides a concise overview of drylands including their physical biological temporal and human components examines the physical systems occurring in desert environments including climate hydrology past and present lakes weathering hillslopes geomorphic surfaces water as a geomorphic agent and aeolian processes offers an accessible introduction to the physical biological temporal and human components of drylands investigates the nature environmental requirements and essential geomorphic roles of plants and animals in this stressful biological environment highlights the impact of human population growth on climate desertification water resources and dust storm activity includes an examination of surface atmosphere interactions and the impact of ENSO events

comprehensive account of some of the most popular models of large watershed hydrology of interest to all hydrologic modelers and model users and a welcome and timely edition to any modeling library

hydrology and global environmental change presents the hydrological contribution to and consequences of global environmental change assuming little or no prior knowledge on the part of the reader the book looks at the main processes of global environmental change global scale processes large regional processes repetitive processes and how the hydrological cycle processes and regimes impact on gec and vice versa

ecohydrology emerges as a new field of research aiming at furthering our understanding of the earth system through the study of the interactions between the water cycle and vegetation by combining the analysis of biotic and abiotic components of terrestrial ecosystems this volume provides a synthesis of material on arid and semiarid landscapes which is currently spread in a number of books and journal articles the focus on water limited ecosystems is motivated by their high sensitivity to daily seasonal and decadal perturbations in water availability and by the ecologic climatic and economic significance of most of the drylands around the world conceived as a tool for scientists working in the area of the earth and environmental sciences this book presents the basic principles of eco hydrology as well as a broad spectrum of topics and advances in this research field the chapters collected in this book have been contributed by authors with different expertise who work in several arid areas around the world they describe the various interactions among the biological and physical dynamics in dryland ecosystems starting from basic processes in the soil vegetation climate system to landscape scale hydrologic and geomorphic processes ecohydrologic controls on soil nutrient dynamics and multiscale analyses of disturbances and patterns

a state of the art overview of the influence of terrestrial vegetation and soils within the earth system the text deals especially with interactions between the terrestrial biosphere and the atmosphere via the hydrological cycle and their interlinkage with anthropogenic activities measurements gathered in integrated field experiments in the sahel the amazon north america and south east asia confirm the importance of these interactions observations are complemented by modelling studies including regional models that simulate flows and transport in river catchments coupled land cover and regional climate systems and earth system and

global circulation models water nutrient and sediment fluxes in river basins are also discussed and are shown to be highly impacted and regulated by humans through land use pollution and river engineering finally the book discusses environmental vulnerability and methodologies for assessing the risks associated with regional and global climatic and environmental variability and change the results reported in this book are based on the research work of many individual scientists and teams around the world associated with the objectives of the igbp bahc and wcrp gewex international research programmes

examines the processes operating in the headwaters and main channels of ephemeral rivers in semi arid environments and includes coverage of current fieldwork investigations modeling approaches and management issues focuses on dryland channel networks and processes presents a historical framework for research discusses examples of current studies and evaluates contemporary modelling approaches emphasis is on the mediterranean region with comparisons to other dryland regimes eg california australia chile

aerial photography has revealed the striking widespread phenomenon of repeating patterns of vegetation in more arid areas of the world two interdependent phases bands of dense and sparse vegetation alternate in the landscape this volume synthesizes half a century's accumulated knowledge of both theoretical and applied landscape functions from a variety of these regions it covers structure dynamics and methods of study as well as disturbances to these landscapes and relevant management issues chapters are included to discuss the role of modeling in answering questions about the origins and complex processes of banded landscapes

studies of banded landscapes have yielded valuable lessons for understanding other semi arid landscapes as well leading to a knowledge base facilitating sustainable use and rehabilitation

this report examines the progress made by the government since 2002 in delivering services and information online it examines three main areas the quality of online provision how it is organised and its cost and future developments and strategy the recommendations aim to help departments assess the costs and benefits of online provision improve its quality and encourage and assist citizens to use the services overall some 208 million is spent each year on website provision with many positive signs of well used services but there is further potential for value for money gains the planned transition to focus heavily on two supersites direct gov uk and businesslink gov uk is an ambitious undertaking that would be the first of its kind in the world it needs to be managed carefully

the study presents the analyses of field observations and simulation experiments with an event based two dimensional hydrodynamic model the model summarized the interactions between temporally dynamic rainfall infiltration process and surface runoff in a catchment with varied soil physio hydraulic properties surface roughness slope lengths and vegetation structure both observation and simulation results indicate that the observation scale affects runoff coefficient and runoff discharge per unit area the effect of scale is a result of spatial variability in infiltration opportunities which vary with the slop length and distribution of saturated conductivity leading to different trasmission losses potential during runoff routing downslope the magnitude of the difference is influenced by surface and vegetated microtopography which determine the flow rate back cover

although the spatial dimension of ecosystem dynamics is now widely recognized the specific mechanisms behind species patterning in space are still poorly understood and the corresponding theoretical framework is underdeveloped going beyond the classical turing scenario of pattern formation spatiotemporal patterns in ecology and epidemiology

arid and semi arid regions face major challenges in the management of scarce freshwater resources under pressures of population economic development climate change pollution and over abstraction groundwater is commonly the most important water resource in these areas groundwater models are widely used globally to understand groundwater systems and to guide decisions on management however the hydrology of arid and semi arid areas is very different from that of humid regions and there is little guidance on the special challenges of groundwater modelling for these areas this book brings together the experience of internationally leading experts to fill a gap in the scientific and technical literature it introduces state of the art methods for modelling groundwater resources illustrated with a wide ranging set of illustrative examples from around the world the book is valuable for researchers practitioners in developed and developing countries and graduate students in hydrology hydrogeology water resources management environmental engineering and geography
